GIS for Economists 4

Giorgio Chiovelli Sebastian Hohmann Tanner Regan

23/05/2022

Overview The plan for today

Spatial Network in Applied Economics

- Storeygard, 2016
- Replication of Donaldson and Hornbeck, 2015

Spatial Network Analysis in GIS

- Introduction to Network
- Solving Best Route problem
- Djkastra Algorithm

Trasport Costs and Economic Development: Storeygard (2016)

Storeygard, Adam (2016). "Farther on down the road: transport costs, trade and urban growth in sub-Saharan Africa" RES 123(1): 139-176.

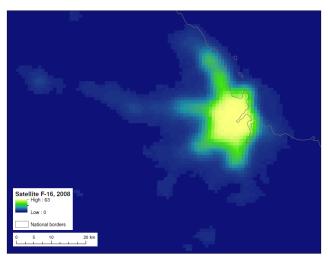

Motivation

How inter-city connectivity determines the income of sub-Saharan African cities.

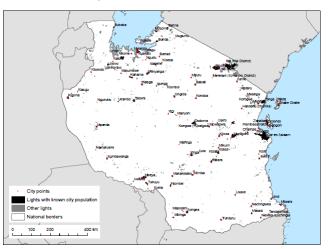

Contribution

Using road quality/type, lights, and oil price shock, estimates how growth is propagated far away from the city port. Negative elasticity of city economic activities wrt transport costs. Effect is heterogeneous in road quality (paved/unpaved).

Luminosity (2008) in Dar el Salaam

City Distribution in Tanzania

Roads connection to Dar el Salaam (Tanzania)

Trafficking Networks and the Mexican Drug War: Dell (2016)

Dell, Melissa (2016). "Trafficking Networks and the Mexican Drug War" AER

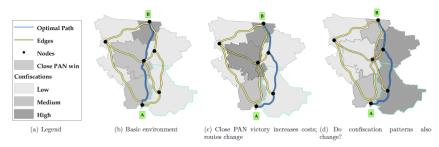

Motivation

How crime repression policy affects spatial pattern of violence and crime .

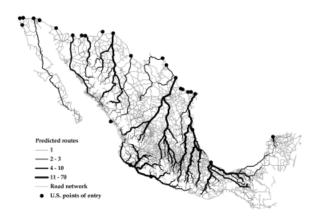

Contribution

Using close elections, disaggregated crime data, and road network, to identify how crime reacts to crackdown policy. Quantification of externalities and unintended consequences of crime repression.

Roads Network and Predicted Trafficking Routes

Railroads and American Economic Growth: Donaldson and Hornbeck (2015)

Donaldson, Dave and Hornbeck, Richard (2015). "Railroads and American Economic Growth: A "Market Access" Approach" QJE

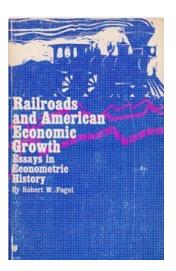

Motivation

• Evaluate the role of railway construction for US economic growth.

Debate

 Local effect vs Aggregate effect for program evaluation. Particularly relevant if spillovers are present (SUTVA violation).

Fogel's Big Idea: Cost-Benefit Analysis

Railroads and American Economic Growth: Donaldson and Hornbeck (2015)

Contribution

- Combine transportation network over time and census data to show that expansion of the railway network fostered both local and aggregated economic growth.
- Theory-based application of intra-country trade model (Eaton and Kortum, 2002) in a reduce form framework to quantify the spillover effect of infrastructure project.

Findings

 Railways expansion fostered US economic growth. Aggregate effects are considerably larger than local effects (due to higher "market access").

Market Access - Theoretical Insights

- Ricardian spatial general equilibrium models of inter-district trade and spatial development (Eaton and Kortum, 2002)
 - Many regions
 - Differential access to technology
 - Efficiency varies across commodities and regions
 - Regions inputs are mobile within region
 - Geographic barriers to trade [Transportation Costs]

Market Access - Theoretical Insights

 Gravity equation where bilateral trade across district origin and destination:

$$\ln X_{o,d} = A_o(X,\tau) + B_d(X,\tau) - \theta \tau_{o,d}.$$

- $X_{o,d}$: total bilateral trade from origin to destination district.
- θ : "trade elasticity". Region's productivity for a given good (variety) is drawn from Frechét distribution with parameter θ
- $A_o(X, \tau)$: origin's productivity and factor costs
- $B_d(X, au)$: destination's productivity and factor costs

Railroads and American Economic Growth: Donaldson and Hornbeck (2015)

Key expression that provides a first-order approximation to counties' market access:

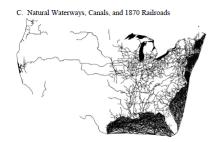

$$MA_o \approx \sum_d \tau_{od}^{-\theta} N_d$$
 (1)

where:

- MAo: Market Access at origin (o)
- tau_{od}: bilateral transportation cost between origin (o) and destination (d)
- N_d: Population count at destination (d)

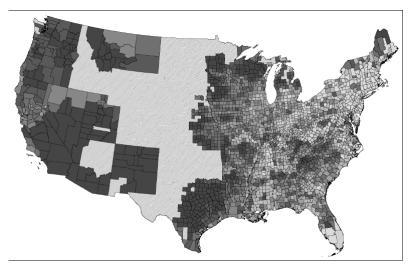

In our application, we are interested in deriving τ_{od} .

Railway expansion 1870-1890

Change in Market Access 1870-1890

$$InV_{ot} = \beta In(MA_{ot}) + \delta_o + \delta_{st} + f(x_o, y_o)\delta_t + \epsilon_{ot}$$
 (2)

- ullet V_{ot} agricultural land values in county o and year t
- MA_{ot} market access
- δ_o county fixed effect
- δ_{st} state-by-year fixed effects
- $f(x_o, y_o)\delta_t$ cubic polynomial in county latitude and longitude interacted with year effects

Replication DH network construction - Missouri

Cost Parameters (Fogel, 1962)

- River = 0.0049 USD (tons/mile)
- Rail = 0.0063 USD (tons/mile)
- Wagon Routes = 0.231 USD (tons/mile)

Total Cost = Parameter x Lenght (in miles)

Replication DH network construction - Missouri

Solving the Best Routes Problem

- We are going to solve the network in **1870** and 1890
- We obtain a matrix of 114x114 of bilateral transportation costs
- ullet This is the au in the Market Access expression
 - Cost Parameters (Fogel, 1962)
 - River = 0.0049 USD (tons/mile)
 - Rail = 0.0063 USD (tons/mile)
 - Wagon Routes = 0.231 USD (tons/mile)

Total Cost = Parameter x Lenght (in miles)

What is a Network in GIS

- GIS networks represent routes upon which people and goods can travel.
 - interconnected lines (edges)
 - intersections (junctions)
- The object traversing the network follows the edges, and junctions appear when at least two edges intersect.
- Junctions and edges can have certain attributes increasing the cost of traveling in the network
- Networks are either directed or undirected

Types of networks in GIS

- Utility networks
 - water mains, sewage lines, etc
- Transportation networks
 - o roads, railroads, etc
- Networks based on social connections

Common Applications in GIS Networks

- Shortest Path. Finding the shortest path between two points
 - Google Map and Waze
- Traveling Salesman. Reaching every point in a network in the most efficient way possible
 - UPS uses a traveling algorithm (no left turns!)
- Network Partition. Dividing up of regions in a network to zones or subcategories.
 - Optimal location of fire stations

Networkx (and Geopandas + Shapely)

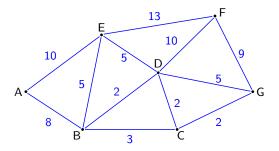

Networkx

- Python package for the creation, manipulation, and study of the structure, dynamics, and functions of complex networks.
- Much more than "just" spatial network (classic graphs, random graphs, and synthetic networks)
- Convenient way of importing shapefile as network graph
- Install: conda install -c anaconda networkx
- Conflict with Python 3.9.
 - Solution: https: //github.com/smicallef/spiderfoot/issues/1124

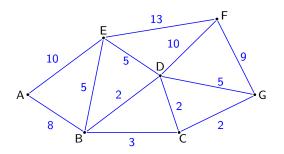

Workflow

- Prepare your network
 - Clean your line (roads, railways) shapefile
 - Set your cost parameter, if needed. e.g. Railways faster than roads
- Construct you graph
 - Check connectivity
 - Add attribute to nodes and edges
- Solve for the best route problem (Dijkstra's algorithm)
- → open network_new_and_improved.ipynb

Aim: Wish to travel $A \rightarrow F$ along **shortest path**.

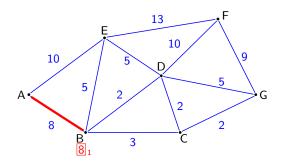

Aim: Wish to travel $A \rightarrow F$ along **shortest path**.

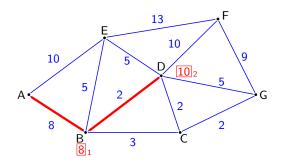

- 1 pick unvisited vertex with lowest distance (first vertex = 0)
- 2 calculate distance through each unvisited neighbour
- 3 pick unvisited neighbour with lowest distance as new current vertex
- 4 a vertex counts as visited once done with all its neighbours

Aim: Wish to travel $A \rightarrow F$ along **shortest path**.

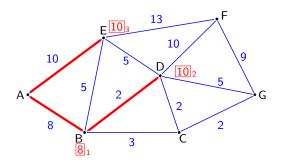

- 1 pick unvisited vertex with lowest distance (first vertex = 0)
- 2 calculate distance through each unvisited neighbour
- 3 pick unvisited neighbour with lowest distance as new current vertex
- 4 a vertex counts as visited once done with all its neighbours

Aim: Wish to travel $A \rightarrow F$ along **shortest path**.
